

The Fertilizer Game

Enumerator Field Guide

How to set up the tablet, run a session with a farmer,
and get the data safely to the server

CIMMYT Field Experiment Tool

Read this together with the farmer-facing “Fertilizer Game” guide.

1. What you need before the field

Your kit

- A charged **Android tablet** (landscape).
- **Internet once**, to install the app and to sync data (mobile data or wifi).
- Your **Enumerator ID** and the **list of Participant IDs** for the day.

Credentials

Admin PIN CIMMYT1234

Sync server address <https://fertilizer-game-server.bismignot.workers.dev>

Sync (bearer) token _____ (from your study coordinator)

Keep the bearer token private. On most deployments the coordinator pre-enters it on each tablet, so you will not need to type it.

2. Set up the tablet (do this once)

Step 1 — Install the app

1. Connect the tablet to the internet.
2. Open **Chrome** and go to the game's web address (the *app* address, not the server address).
3. In the Chrome menu (⋮) choose **“Add to Home screen”** / **“Install app”**.
4. Open the app once and let it finish loading. It now stores everything on the tablet and **works fully offline** — you do not need internet to run sessions.

The Welcome screen. This is the “home” of the app. You always start and return here.

Step 2 — Open the Admin panel

The Admin panel is for you, the enumerator — not the farmer. Open it from the Welcome screen by either:

- pressing the screen with **four fingers** and holding briefly, or
- tapping the small circle in the **top-right corner**.

Then enter the **PIN** and tap **Unlock**.

Enter the Admin PIN (CIMMYT1234).

Step 3 — Configure syncing

Go to the **Sync** tab and:

1. Type the **Server URL** and the **Bearer token** (your sync password).
2. Tap **Save**.
3. Tap **Test connection**. You should see **Connected (200)**.

The Sync tab, set up correctly. Save first, then Test connection — **Connected (200)** means the tablet can reach the server.

Step 4 — Quick checks (optional but recommended)

Diagnostics — check the app is offline-ready, storage is healthy, and battery is fine.

Export / Import — import the participant list (CSV), and later export data as a backup.

Tap **Close** to leave the Admin panel.

3. Run a session with a participant

Step 1 — Start the session

On the Welcome screen tap **Begin**. Fill in:

- **Participant ID** (from your list — this is what links the game to the baseline survey),
- **Enumerator ID** (yours).

The token-to-Naira rate is fixed at **5 NGN per token** (not editable). Then tap **Start session**.

The setup form. The Participant ID is important: it decides the (random but reproducible) rain and price results, so the session can be checked later.

Step 2 — The participant plays

The participant now: chooses the **language**, watches a short **tutorial video** in that language, sees a short **picture lesson** about chance, plays **1 practice season**, then **10 real seasons**. Each season they read the rain & price outlook and choose how much fertilizer to buy. (See the separate *farmer* guide for how the game works.)

Your job during play

Read or explain the screens if asked, and make sure the participant understands the pictures — but **never tell them how much fertilizer to choose**. The whole point is to record *their* decision. Let them tap the buttons themselves where possible.

Step 3 — Pay the participant

At the end you see **Your final earnings**: the tokens from each of the 10 seasons, the total, and the amount in **Naira (NGN)**. **Pay the participant that Naira amount**.

*The final earnings screen. Tokens convert at 5 NGN per token; here 253 tokens = 1,265 NGN. Pay the Naira figure shown. Tap **Continue** and the “thank you” screen ends the session.*

4. Start the next participant (read carefully)

When you reach the “thank you” screen, the participant is finished and **their data is already saved on the tablet**.

To start the next participant

Tap the **Next participant** button on the “thank you” screen. It takes you straight to the setup form for the next person and **keeps all the data from earlier participants** on the tablet. (If the app was closed, just reopen it — it returns to Welcome with the data kept.) You can run many participants on one tablet this way before syncing.

Do NOT tap the grey “Reset” button to move on

The grey  **Reset** button (bottom of the screen) **erases EVERY session stored on the tablet**. It is only for wiping a tablet *after* the data has been safely synced, or for discarding a test. **If you tap it before syncing, that data is gone**. Ask your coordinator to switch this button off for fieldwork.

If the tablet switches off or the app closes during a session

Do not worry — just **reopen the app**. It **resumes the unfinished session exactly where it stopped**. Nothing is lost. (A finished session does not resume; the app simply goes to Welcome.)

5. Send the data to the server (syncing)

Sessions stay on the tablet until you sync them. Sync **whenever you have internet** — at minimum at the **end of each day**.

1. Get the tablet online (wifi or mobile data).
2. From **Welcome** open the **Admin** panel → **Sync** tab.
3. Tap **Sync now**. Each completed session uploads (*syncing* → *synced*).

Good to know

- **Safe to repeat**. Tapping Sync now again never creates duplicates — already-sent sessions are simply skipped.
- **Only finished sessions** are sent. An unfinished session waits until it is completed.
- **Nothing is deleted** from the tablet by syncing — the sessions stay as a backup, now marked *synced*.
- **If it fails** (weak signal), it marks the session *failed* and will retry the next time you tap Sync now.

Check that it worked

Open the **Sessions** tab. The **Sync** column should show **synced** for finished sessions.

The Sessions list. Each session shows the participant, group, tokens, and a sync status: **synced** (on the server) or **pending** (still only on the tablet). Sync again until everything shows synced.

No internet for a long time?

The data is safe on the tablet — sync when you next get a signal. If you must hand the data over without internet, use **Admin** → **Export / Import** to download the files and give them to your coordinator.

6. Golden rules

1. **To move to the next participant: close and reopen the app.** Never use Reset for this.
2. **Sync (or export) before wiping a tablet.** Once data is gone from the tablet *and* not on the server, it cannot be recovered.
3. **Sync at the end of every day**, and check the Sessions tab shows *synced*.
4. **Never tell a participant what to choose.** Record their own decisions.
5. **Keep the PIN and the sync token private.**
6. **Keep the tablet charged** — check the battery in Diagnostics.

7. Troubleshooting

Problem	What to do
Test connection / Sync fails with <i>401</i> or <i>403</i>	Wrong or empty token. Re-type the Bearer token in the Sync tab, Save, and test again.
Test connection fails with no number	The tablet has no internet, or the server address is wrong. Check your signal and the Server URL.
“Sync” says some sessions <i>failed</i>	Weak signal during upload. Get a better connection and tap Sync now again — it retries automatically.
The app won’t open / blank screen	Reopen it. If it was never loaded online first, connect to internet once and reload.
A session seems stuck or the tablet restarted	Reopen the app; it resumes the unfinished session.
I tapped Reset by mistake	Sessions already <i>synced</i> are safe on the server. Anything only on the tablet and not yet synced is lost — tell your coordinator.

CIMMYT Fertilizer Risk-Communication Experiment. Screens shown are the English version; the game is also played in Hausa. Keep this guide with the tablet.

This game is adapted from the MIT-licensed *Investment Game* originally developed by the Alliance of Bioversity International & CIAT and IFPRI; the CIMMYT version reframes it for fertilizer investment under rainfall and price uncertainty.
